DETAILED ACTION

Information Disclosure Statement

The information disclosure statement (IDS) submitted on 07/07/2005 has been considered by the examiner.

The information disclosure statement (IDS) submitted on 07/21/2006 has been considered by the examiner.

Allowable Subject Matter

Claims 1-4 are allowed.

The following is an examiner's statement of reasons for allowance:

Independent claim 1 defines features of line extracting means for extracting only portions parallel to the tilt of the lower edge of the mandible from the found skeleton; binarizing means for binarizing an image including the skeleton so that lines of the skeleton are separated from the background; and determining means for determining whether there is risk of osteoporosis by classifying the binarized lines according to size. These features in combination with other features in claim 1, which is the broadest allowable claim, are not taught or suggested by the art of record.

Claims 2-4 are dependent upon claim 1.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Lang et al, U.S.P.N. 6,690,761 B2, teaches identifying regions of interest on an edge of the mandible (see figures 13 and 14), and the regions of interest are subject to binarization process, and then skeletonization process (column 21 and 22) to determine whether the line segment in the region is above or below a threshold, center of mass of the region. The differences between Lang and the instant invention are Lang does not teach a line extracting means as claimed; Lang's system calls for binarization of the image region before skeletonization process, which is different from the claimed step order; and Lang does not teach a determining means for determining whether there is a risk of osteoporosis by classifying the binarized lines according to size.

Michaeli, U.S.P.N. 7,471,761 B2, see figure 6.

Hangartner et al, U.S.P.N. 7,488,109 B2, see abstract.

Grunkin, U.S.P.N. 6,411,729 B1, see whole document for relevancy.
